NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION:
Mapping information for this clone was provided by Dr. John D.
McPherson, Department of Genetics, Washington University, St. Louis
MC. For additional information about the map position of this
sequence, see http://genome.wustl.edu/gsc

# SOURCE INFORMATION:

The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, E. Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at http://www.chori.org pBACe3.6

# NEIGHBORING SEQUENCE INFORMATION:

The clone sequenced to the left is RP11-609N18, 2000 bp overlap; the clone sequenced to the right is CTD-2012I17, 2000 bp overlap. Actual end of this clone is at base position 105788 of CTD-2012I17.

Polymorphisms exist between AC093722 and AC109350.

Consensus quality: 106638 bases at least Q30
Estimated insert size: 181520; agarose-fp estimation
Batimated insert size: 18520; sum-of-contigs estimation
Quality coverage: 6.12 in Q20 bases; agarose-fp estimation
Quality coverage: 10.39 in Q20 bases; sum-of-contigs estimation.

* NOTE: This is a 'working draft' sequence. It currently
consists of 3 contigs. Gaps between the contigs
are represented as runs of N. The order of the pieces
is believed to be correct as given, however the sizes
of the gaps between them are based on estimates that have
provided by the submittor.

* This sequence will be replaced
by the finished sequence as soon as it is available and
the accession number will be preserved.

                                                                                                                                                      63108,
                                                                                                                                                                                                                                                                        Louis
```

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION:

Mapping information for this clone was provided by Dr. John D. McPherson, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc

The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osocgawa, K., Woon, P.Y., Zhao, B., Frengen, E., Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at http://www.chori.org
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    NEIGHBORING SEQUENCE INFORMATION:
The clone sequenced to the right is RP11-80B23, 2000 bp overlap. Actual start of this clone is at base position 1 of RP11-23406; actual end is at base position 3275 of RP11-80B23.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The region from 17296 to 17363 is covered only by a pcr product

Federat No. 681239

GENERAL INFORMATION:

APPLICANT: VENTER, J. Craig et al.

TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUWAN DISEASE, METHODS OF DETECTION AND USES THEREOF

FILE REFERENCE: CL001307

CURRENT APPLICATION NUMBER: US/09/949,016

CURRENT FILING DATE: 2000-04-14

PRIOR APPLICATION NUMBER: 60/241,755

PRIOR APPLICATION NUMBER: 60/237,768

PRIOR FILING DATE: 2000-10-20

PRIOR PILING DATE: 2000-10-03

PRIOR PILING DATE: 2000-09-08

NUMBER OF SEQ ID NUMBER: 60/231,498

PRIOR FILING DATE: 2000-09-08

NUMBER OF SEQ ID NO 130056

LENGTH: 601

TYPE: DNA

ORGANISM: Human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 linkage, has rice actin 1 (RA1) promoter, RA1 intron, Chioroplast transity peptide gene (II), glyphosate tolerant 5-enol-pyruvylshikimate-3-phosphate synthase (EPSPS) gene (III), and transcriptional terminator (IV), and F2 has cauliflower mosaic virus 355 promoter, H8970 intron, (II), (III) and (IV). Also included are two DNA sequences from corn plant Pv-ZMGT32(nk603) of 498 or 1183bp, or primers and probes derived from them (used to detect transgene junction points). The construct is useful for producing a corn plant that tolerates application of glyphosate herbicide by transforming a corn cell with, selecting the corn cell for tolerance to application of glyphosate, and growing the corn cell into a fertile corn plant. The present sequence is a transgene junction probe sequence consisting of Agrobacterium and Rice sequences. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             chloroplast transit peptide gene; glyphosate resistance; corn; 5-enol-pyruvylshikimate-3-phosphate synthase; EPSPS; Hsp70 intron; transcriptional terminator; cauliflower mosaic virus 35S promoter; PV-ZMGT32; transgenic; nk603.

                                                                                                                                                                                                                                                                                                                                                                                                                                                      RESULT 3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a DNA construct (I) comprising a first (Fi) and a second (F2) expression cassette. Fi of the DNA construct, in operable linkage, has rice actin 1 (RA1) promoter, RA1 intron, chloroplast transit peptide gene (II), glyphosate tolerant 5-enol-pyruvylshikimate-3-posphate synthase (EPSPS) gene (III), and transcriptional terminator (II), and F2 has cauliflower mosaic virus 35s promoter, Hsp70 intron, (II), (III) and (IV). Also included are two DNA sequences from corn plant Pv-ZMCT32(nk603) of 498 or 1183bp, or primers and probes derived from them (used to detect transgene junction points). The construct is useful for producing a corn plant that tolerates application of glyphosate herbicide by transforming a corn cell with, selecting the corn cell into a fertile corn plant. The present sequence is the 1183bp amplicon constituting of the Agrobateium transcriptional terminator sequence,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S
                                                                               The present invention relates to novel DNA and protein sequences which are associated with carcinomas. The sequences are useful for: (i) for screening drug candidates; (ii) for screening of bioactive agent capable of binding to Carcinoma Associated protein (CAP); (ii) for screening of a bioactive agent capable of modulating the activity of CAP; (iv) for carcinoma; (vi) for inhibiting the activity of CAP; (iv) for diagnosing carcinoma; (viii) for neutralizing the effect of CAP; (vii) for treating (x) for diagnosing carcinoma; (viii) for neutralizing the effect of CAP; (ix) as a biochip; (x) for diagnosing carcinoma or a propensity to carcinoma; and (xi) for capable (CA) gene sare useful as DNA vaccines and the CAP are useful as markers of carcinoma including lymphoma. The present sequence is one such CA coding sequence. Note: This patent is an equivalent to basic patent.

N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AB877789 represent sequences used in the examplification of the present invention. N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cancer-associated nucleic acid molecules (N) and proteins (P), we proteins are collectively known as colon cancer antigens. The co-cancer antigens have cytostatic activity and can be used in gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC relative gene expression by an observed hybridisation reporter signal of CC a spot in the array. The method is useful for measuring the expression of GC genes in a first Bacillus cell relative to expression of the same genes CC in one or more second Bacillus cells. The method is useful for monitoring CC global expression of several genes from a Bacillus cell, discovering new CC genes, identifying possible functions of unknown open reading frames and CC in expression of genes may be used to provide a representation of the way CC in which Bacillus cells adapt to changes in culture conditions, CC environmental stress or other physiological provocation. Extensive follow cup characterisation is unnecessary, when one spot on an array equals one CC gene or one open reading frame, since sequence information is available. This sequence represents a genomic sequence tag (GST) used in the method CC of the invention. Note: The sequence data for this patent did not form
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

The invention also comprises the Nanoarchaeum equitans genome. The DNA and protein sequences of the invention are useful for diagnosing and treating cancer (e.g. carcinoma, lymphoma, or leukaemia). The present DNA sequence represents a Nanoarchaeum equitans CA gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New recombinant cancer-associated genes, such as KCNJ9, diagnosing or treating carcinoma, e.g. breast, colon, r cervical, or skin cancers, lymphomas, or leukemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC ADC3089) and the polypeptides they encode (ADC3089-ADC31860). The CC ADC3089) and the polypeptides they encode (ADC30890-ADC31860). The CC invention also relates to nucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression convertors and host cells comprising a nucleic acid of the invention; the cerembinant production of a polypeptide of the invention; an antibody compained a polypeptide of the invention; and methods of cells invention further discloses methods to a polypeptide of the invention. The invention further discloses methods to a polypeptide of the invention. The central polypeptides of the invention, and methods of campional antibodies for carrying out the methods of the expression or activity of the polypucleotide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention contig sequences corresponding to the cDNA sequences of the invention of contig sequences corresponding to the cDNA sequences of the invention and polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention are identification of mutations responsible for genetic disorders or other craits, for assessing biodiversity, and in producing many other types of data and products dependent on DNA and amino acid sequences. They are also used for treating diseases such as Parkinson's disease, Alzheimer's cancer. The nucleic acids may also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypeptides or are also useful in generating antibodies, as molecular weight markers, can are also useful in generating antibodies, as molecular weight markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S

The DN sequences of the invention are useful for treating cancer, psoriasis, ulcerative colitis, inflammation, ischaemic heart disease, thrombosis immune disorders, bacterial disorders and viral disorders. The preser nucleic acid represents a mouse DNA sequence of the invention. NOTE: present DNA sequence is not shown in the specification, but has been retrieved from the WIPO website.
                                                                                                                                                                                     CDS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is the parathyroid hormone type-3 receptor (PTH3R) coding sequence from the zebrafish. It was obtained by sequencing a cDNA clone. The gene and protein can be used to detect diseases in man where the receptor is either overexpressed or underexpressed; and they can be used to treat these diseases, which may be developmental, physiological or neurological disorders. They can also be used to identify agonists and antagonists which can be used in a similar manner. In addition, the gene can be used for chromosome identification. (Updated on 15-SEP-2003 to standardise OS field)
                                                      Novel nucleic acid comprising a polynucleotide encoding parathyroid hormone/parathyroid hormone-related peptide receptor, useful for chromosome identification.

(I) is useful for diagnosing and treating decrease in the standard or normal level of PTH1R receptor activity in an individual, and for chromosome identification. This sequence encodes zebrafish PTH3R.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence

The present invention relates to novel parathyroid hormone (PTH) and parathyroid hormone related protein (PTH) receptors PTHIR and PTH3R isolated from zebrafish. The invention is useful in the diagnosis and prognosis of certain diseases and disorders that express significantly decreased levels of PTHIR and PTH3R. The invention is also useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    30-NOV-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           preparaing pharmaceutical compositions and in chromosome assays. present sequence is zebrafish PTH3R cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 2152 BP;
                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Drosophila melanogaster expressed polynucleotide SEQ ID NO 25724.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid genes from Drosophila and interactions.

                                                                                             Ś
                                                                                                                                                                                            The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABIJ6176-ABIJ0511), expressed DNA sequences (ABIJ6176-ABIJ0511), expressed DNA sequences (ABIJ6176) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
